

Introduction to Termux

(and other linux environments on Android
& Chrome OS in non-rooted environments)

Termux

FYI

- We will discuss:
 - about:me
 - Termux
 - F-droid (alternative android marketplace for open source software)
 - Userland via f-droid
 - Chromium OS “linux experiment”
- Kindly hold questions till I ask, which will generally be at the end of the slide or demo.
- Guessing this will take about an hour ish to discuss / have demos.

Who am I?

- I'm a forensic database engineer, web identity specialist, raspberry pi and kite photography enthusiast.
- I'm not a linux administrator.

What is termux?

- Termux is a user land android application that allows you to run linux comands on an android device. It's essentially an app that allows console access into the linux environment.
- Termux is available in the Android Play environment, as well as F-Droid.
 - F-Droid will be discussed later.
- No root is required.
- Loosely based upon debian, but it's not exactly debian.
- ** Browse to termux.com for info. 😊

Welcome to Termux!
Wiki: https://wiki.termux.com
Community forum: https://termux.com/community
Gitter chat: https://gitter.im/termux/termux
IRC channel: #termux on freenode

Working with packages:
* Search packages: pkg search <query>
* Install a package: pkg install <package>
* Upgrade packages: pkg upgrade

Subscribing to additional repositories:
* Root: pkg install root-repo
* Unstable: pkg install unstable-repo
* x11: pkg install x11-repo

Report issues at https://termux.com/issues
$
```

Immediate Demo!

- “Pinch” the screen to increase font size. 😊

Minimum Requirements

- Android 4+... so minimal.
 - (Android KitKat or newer)... released in October 31, **2013**.
 - Even my cheap / disposable phone which I recently purchased on amazon for \$50 was running android 7.
 - With 1gb internal storage, add a sd card, then you have a very cheap server.

Environment Details

- There are a bunch of differences.
 - Important things:
 - Non-standard paths
 - Most dev tools not installed. Need to install build-essential via unstable-repo
 - Single user mode only for permissions. Unable to chroot, etc.
 - Why – android has one user that is not an administrator...
 - See http://termux.com/wiki/Differences_from_linux

But my system froze...

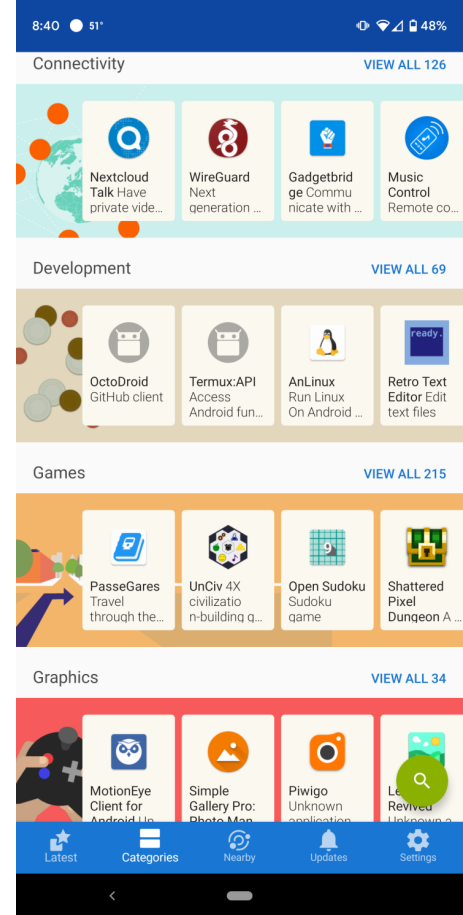

- Yeah, sometimes, termux freezes into an unrecoverable state.
- Just re-install.
- Note that termux can access outside it's most immediate environment, via
 - https://wiki.termux.com/wiki/Internal_and_external_storage

How to install

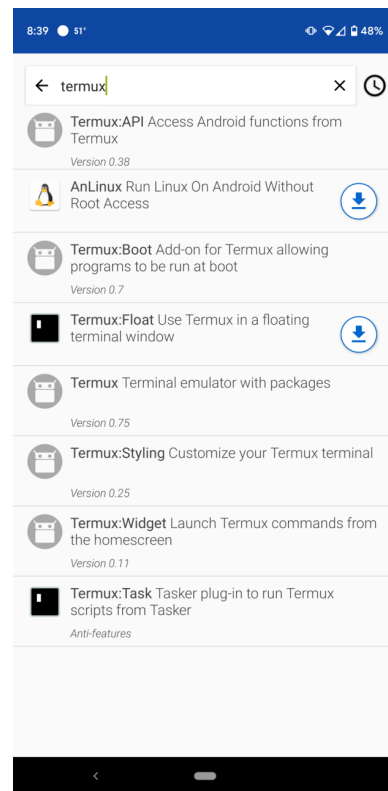

- There are *two* ways.
 - The first is google's play store marketplace. There is a \$1.99 charge for this.
 - The second way is via the open source f-droid marketplace. Browse to <https://f-droid.org/>. Free.

Tangent – f-droid

- Browse to f-droid.org
- F-droid is a repository of free and open source projects that run on android.
- Requires you to install packages from unauthorized sources, so you will have to do a security dance to make it work. :-/

Termux offerings on f-droid

There are additional add ons in the store

- Termux-api – allows termux to access other aspects of the android device.
- Termux-styling
- Termux-boot – boot a script at startup. (SSH, httpd, etc)
- Termux-widget – run termux as a on screen widget.
- Termux-task – run a script from the task menu.
- Termux—float – allows it to be floated instead of a window
- Termux-tutorials *unofficial tutorials*.

Connecting over ssh

- Determine your user
 - whoami
 - # returns u0_a465 for me
- Set a passwd for yourself
- Install ssh
 - pkg install openssh
 - sshd
 - ssh u0_465@localhost -p 8022

And there are additional options for running linux, again as a non-root user

- Anlinux – custom scripts to setup termux to run ubuntu, fedora, centos, openSUSE, etc. on your device, as a layer above termux.
- Userland – separate from termux, allows for devices to run complete installs of linux. Graphical sessions available, via vnc.
 - Even on fios, it takes about 20 minutes to download everything needed to get it to work, and still slightly unstable.

Chrome os linux experiment

- It's a debian container, that runs on chrome os devices
 - Mostly el-cheapo tablets type machines.
 - (Reminder zaz - <control>+ to increase screen size. 😊)
 - CAUTION : slightly non-standard system.
 - There are some folders you can't create or use... even as uid 0, such as /usr/local/bin/

Conclusion

- It's possible!
- It's different!
- It's more unstable than we would like, but usable!
